Subject: Specialized search for 09/918,187

Hi David Schreiber-

I was wondering if you could run the type of specialized search we discussed for antisense sequences, wherein you rank ordered the hits using an Excel spreadsheet to pull up short, greater than 80% match hits for 09/918,187?

Could you please run a length limited nucleotide sequence search against of SEQ ID NO:3 that returns hits 8-50 nucleotides then rank orders the hits based on percent complementarity over the whole oligo, exactly as you performed previously? The pending files are not necessary at this time and EST databases are also not required. Please let me know if there are any questions. The number of hits to collect in the first round would be your best judgement.

Thanks,
Karen
